

Straight-Line Test: Rejection of Gaussian Falloff in Favor of Heavy Power-Law Tail
On a $\log(A)$ vs. b^2 axis, a Gaussian is strictly a straight line; the lattice data bends upward into a power-law.

— PySR Power-Law $\propto (1 + b^2)^{-1.39}$ - - Gaussian Ansatz $\propto e^{-0.058b^2}$ (Straight line) $\bullet$ Lattice Data ($b \geq 3a$)
